# Scopely Android Challenge
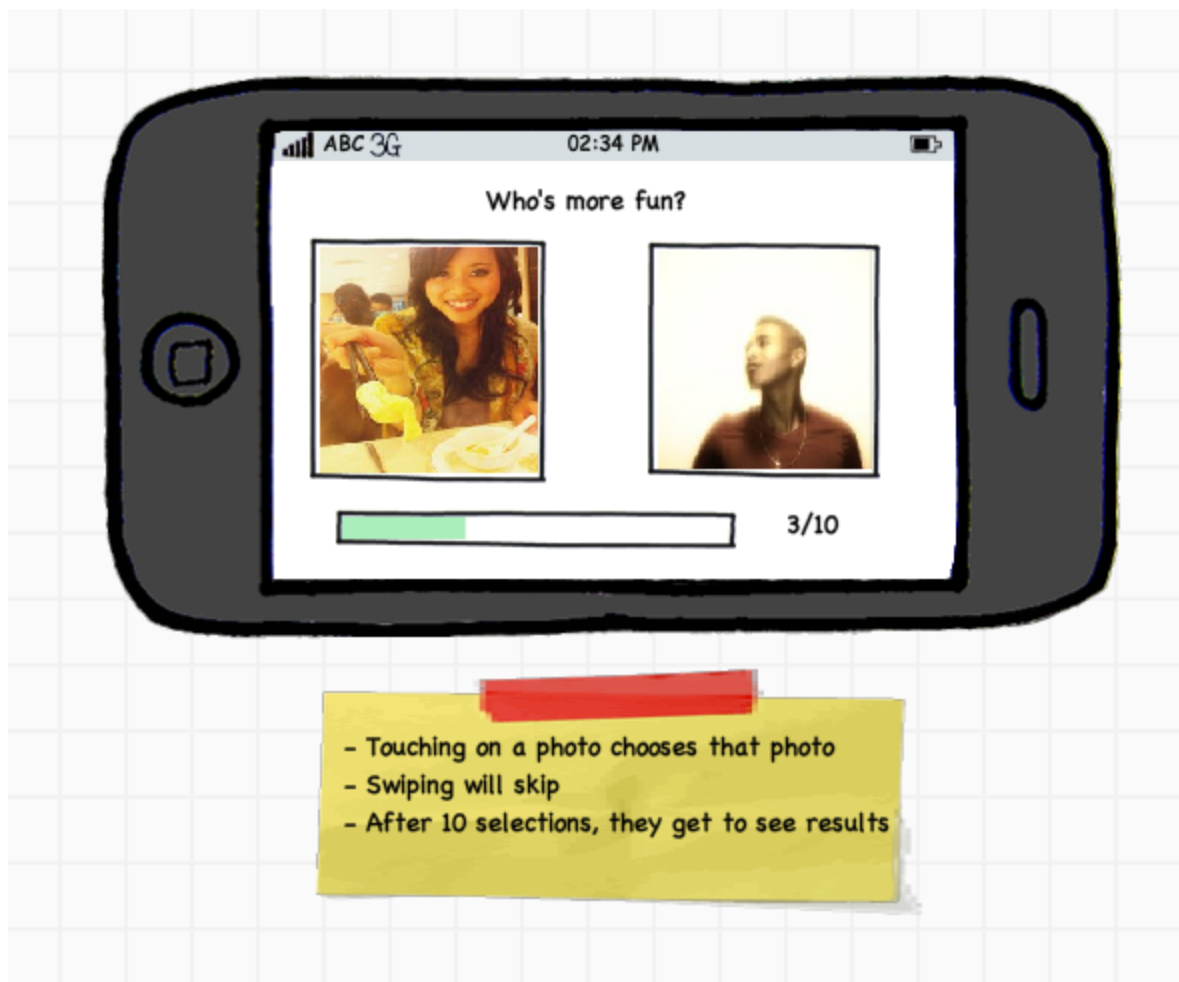

The goal is to build a simple Android-version of the BranchOut "hot-or-not" duel. The app is no longer live on Facebook, but we've included a screenshot below:
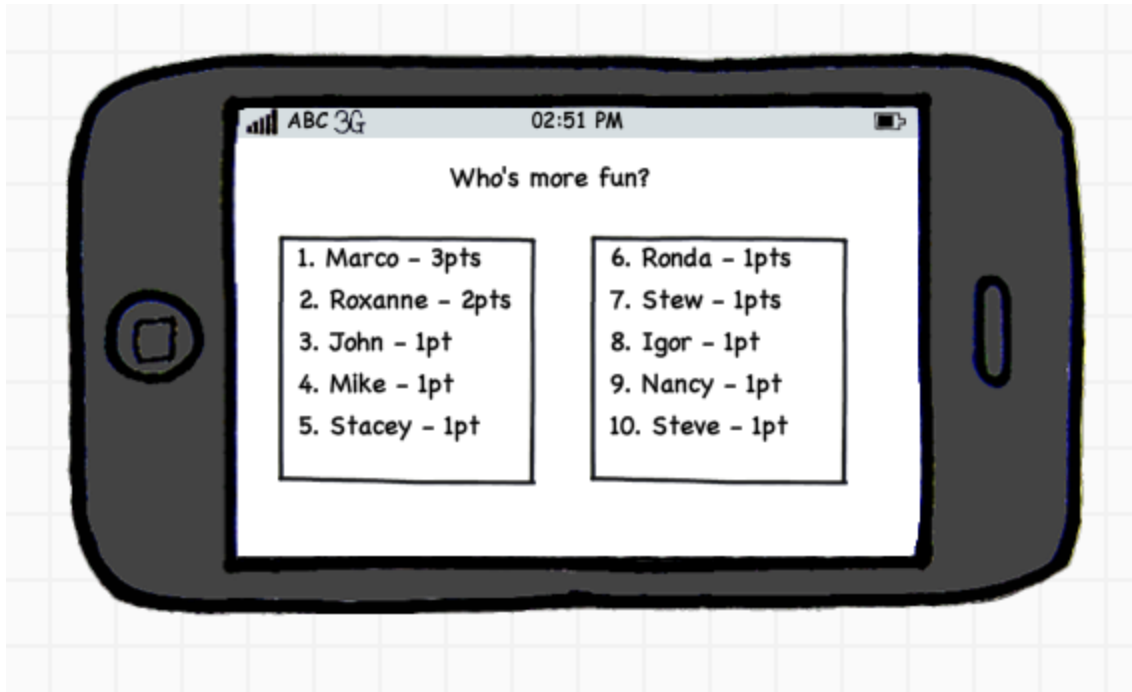

Android Version

The basic flow is :

1. Integrate with Facebook Android connect:
   https://github.com/facebook/facebook-android-sdk

2. Pull a list of friends from the Facebook API

3. Display a UI, an example given below, that randomly selects two friends, lets the user select "Who's more fun", and then shows the next two friends. After 10 selections, it will display a rank of the results

4. After they select 10 friends, they will be able to view a ranking as shown below

Please note the screenshots are an example only. You are free to design your own screens, layouts and interactions.

Guidelines

Writing the app, use whatever libraries you find useful, but this should be your own app, demonstrating how you'd approach the problem. Use of example code and sample apps should be judicious. This coding challenge should be completely solely by you. You cannot receive any assistance or submit any code authored by or with someone else. However, you may reference public open source libraries.
